EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to Applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows:

In the specification, on p. 2, line 8 [or] has been deleted before "each phase", and on p. 3, line 34, following "means that", the redundant [that] has been deleted.

2. Applicant's attention is directed to the fact that there are no drawings on file in the instant 371 application. Therefore, for examination purposes, the drawings submitted with the underlying PCT/FR03/03659 application have been used. In order to avoid abandonment of the application, Applicant must submit separate drawings for the instant 371 application.

3. The following is an examiner's statement of reasons for allowance:

The allowability resides in the overall structure of the device as recited in sole independent claim 1, and at least in part, because claim recites, *inter alia*: "a rod (4A) extending between a first end (4B) provided with catch means (4C) and a second end (4D); and [...] the second end (4D) of the rod (4A) is provided with a contact element (7) [...] the bimetallic strip (6) being firstly arranged in the device so as to be sensitive to heat given off by the protector unit (2)". The aforementioned limitations in combination with all remaining limitations of said claim

I, are believed to render the claim an all claims dependent therefrom patentable over the art of record.

US/5,231,367 to Ikeda et al is believed to be the closest to the present invention, disclosed (Fig. 1) a protector device (31) for protecting electrical equipment, the device comprising: a protector unit (41-45) connected to the electrical equipment via a connection circuit (37, 38); said connection circuit comprising: a first connector (37) connected to the electrical equipment; a second connector (38) connected to the protector unit; and electric current interrupter means (41, 43) movable between a return position corresponding to the circuit being open-circuit, and a position corresponding to the circuit being closed; said interrupter means (41, 43) comprising: a rod (43) extending between a first end provided with catch means (41) and a second end; and said rod (43) being mounted to slide axially and resiliently between a first abutment position which is also a return position corresponding to the circuit being open-circuit, and a second abutment position corresponding to the circuit being closed; said catch means (41) co-operating with blocker means (44a, 45a) to hold the rod (43) in its second abutment position; said device further comprising a bimetallic strip (44, 45) wherein the first end of the rod (43) is provided with a contact element (41a) establishing electrical contact between the first and second connectors (37, 38) when the rod (43) is in its second abutment position, the bimetallic strip (44, 45) being firstly arranged in the device so as to be sensitive to heat produced due to the self-heating thereof, and being secondly designed in such a manner that when the temperature of the protector device (31) reaches a predetermined critical value, the bimetallic strip (44, 45) produces a deactivation force for deactivating the blocker means (44a, 45a) so as to cause the interrupter means (41, 43) to pass into its position in which the connection circuit is open-circuit.

Ikeda et al, however, has failed to disclose that the rod's second end is provided with the contact element and that the bimetallic strip is being arranged in the device so as to be sensitive to heat given off by the protector unit, as required by claim 1 of the instant application. Unlike the protector device of the instant invention, the Ikeda's et al protector device comprising the rod (43) having catch means (41) and the contact element (41a) both mounted on the same first end of said rod (43). Further, in the Ikeda's protector device the bimetallic strips (44, 45) are sensitive to the self-heating, unlike the bimetallic strips of the instant invention, which are sensitive to the ambient heat.

The additional references cited on PTO-892 teach various thermally actuated circuit interrupters employing bimetallic and meltable actuating elements.

None of the cited references either taken alone or in combination, is believed to render the present invention unpatentable as claimed.

Furthermore, Examiner has conducted the assignee and inventor name searches in order to identify documents with possible double patenting issues. No documents with conflicting claims have been identified.

4. Any comments considered necessary by Applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
